Q&A Handling and Storage of STRUX Tool Seal

Bondline Products Corporation supplies STRUX Tool Seal Kits, STRUX is a positive proven tool sealing system used to stop and prevent leaks in composite/Metal bond tooling used for curing parts in autoclaves or ovens to 400 Deg F.

Cost Savings-Instead of replacing a costly tool preserve its operation with STRUX Tool Sealing System. STRUX* has a proven record and is used to seal leaking tools for continued use. STRUX* was applied to eight BOEING C-17 Composite Tools on a "No Cure/No Pay" basis and all passed a Helium leak rate test and continued autoclave use. STRUX has been the first choice for many Aerospace companies and has been in use for over two decades...

STRUX shelf life and handling is important, Bondline Products policy has been to recommend that the material be kept at ambient temperature in storage. We also recommend that fabrication or usage occur within the packaged expiration date period.

Please Note that STRUX Tool Seal when mixed according to instructions will cure to a tough thin elastomeric film, and it is at the customer's discretion to determine if this application is appropriate for their specific tooling needs.

When proper storage conditions are adhered too physical properties are not affected.
